Sonarvision 4000

The Sonarvision 4000 with its entirely new Composite transducer array and digital processing has closed the considerable gap which previously existed between underwater television pictures and previous sonar systems.

The interpretative qualities of Sonarvision 4000 are defined by the target shape, size colour or shade variations and shadows. This allows ease of interpretation by the operator allowing him to take fast decisions.

The simulated audio and user friendly features reduce operator fatigue and provides a very high degree of confidence in decision making about targets and work
